

Instructions for running the task

Prerequisites

This setup requires Python and minstack to be installed. The minstack can be started with:

```
ministack
```

Do not stop the minstack but open a new terminal to continue to interact with it.

Running the task

The provisioning and tests are all bundled in the `run_dev.sh` script. It creates the S3 buckets, lambda functions, notifications and ultimately starts the tests.

The resources are all provided in this folder. Ensure that you are in the directory for the script to work.

```
./run_dev.sh
```

Resources

The run script relies on the following resources: - data: Input data for the tests - src/lambda: Each folder represents a separate lambda function - src/test: The integration test script
